Geometry compilation contest Problem analysis

Artem Vasilev Vitaly Aksenov

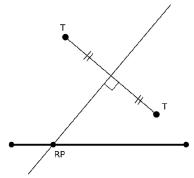

ETH Zurich Training Week, April 2017

Find the maximal distance from the (0,0) - - (L,0) segment to *n* given points.

▲日 → ▲圖 → ▲ 国 → ▲ 国 → 二 国

- Use binary search on the answer R.
- One point covers the intersection of line with the circle of radius *R*.
- Check that these intersections cover the line completely.
- $O(N \log N \log R)$.
- You may notice that you don't need to sort events, and the "check" part can be done in O(N).
- $O(N \log R)$ solution.

• Two points split their area of influence (segment where this point is the closest one) by the perpendicular bisector.

• Each point could have only one segment of influence.

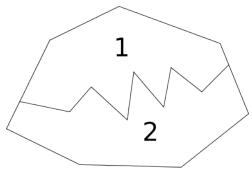

- We could use a "convex hull" trick for the points, process them from left to right.
- Add new point and pop points from stack until our new point "covers" their intervals.
- Finally, add new point on stack and calculate its interval.
- After all intervals are calculated, get answer in O(N).

You need to find a polygon that contains all given points as vertices such that the area of the polygon is not smaller than the half of an area of the convex hull.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

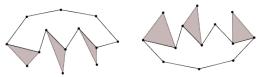

B. Rural planning Solution

- Suppose we split the convex hull into 2 chains: lower and upper.
- Then, we take all the points inside and make an arbitrary polyline through them.

• Larger of these 2 polygons will have area greater than half of the convex hull.

- We can extend the larger polygon to use the points from the other hull.
- As these points are from convex hull, the area only increases if we add them.
- Go through points from the other hull and connect them to the nearest point to the left and to the right.

• Output the larger of two polygons.

Draw two non-intersecting circles of maximum possible radius R inside the given convex polygon.

<ロト < 回 > < 回 > < 回 > < 回 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Run binary search on the answer R.
- Then shift all the sides of the polygon inside by *R*.
- Intersect new *n* half-planes. The lines are already sorted by angle, so this step is similar to Graham's algorithm for finding the convex hull.
- Find the diameter of the new polygon in linear time using rotating calipers.

イロト 人間ト イヨト イヨト

- You have to place *N* circles with centers in the rectangle, such that they do not intersect.
- It is known that the area of the rectangle is 5 times bigger than the total area of circles.

- 4月 ト 4 ヨ ト 4 ヨ ト

- Insert circles in the order of decreasing radius.
- For each circle we choose the random point and check if we can place a mat there.
- The total area of bad points does not exceed $\sum_{j=0}^{i-1} \pi (R_i + R_j)^2 \le 4 \sum_{j=0}^{i-1} \pi R_j^2 \le \frac{4}{5}S.$
- Thus with probability at least $\frac{1}{5}$ we find a good point.

- During each step you could rotate the current position 90 degrees clockwise around some of the given points.
- Find the maximal distance you could get from (0,0) after M steps.

• • = • • = •

- Rotation around the point is the same as multiplying the vector by -i.
- $P_1 Q = -i \cdot (P_0 Q)$, thus $P_1 = -i \cdot P_0 + (1 i)Q$.
- Suppose we rotate M times the starting point P_0 :

$$P_n = -i \cdot P_0 + (1-i) \cdot (Q_{M-1} + Q_{M-5} + \ldots) + (-1-i) \cdot (Q_{M-2} + Q_{M-6} + \ldots) + (-1+i) \cdot (Q_{M-3} + Q_{M-7} + \ldots) + (1+i) \cdot (Q_{M-4} + Q_{M-8} + \ldots).$$

イロト 不聞 と 不良 と 不良 とう 悪

- For each direction v we want to choose the furthest point in direction $(1-i) \cdot v$, which will replace Q_{M-1}, Q_{M-5}, \ldots
- Similarly, for Q_{M-2}, Q_{M-6}, \ldots in direction $(-1-i) \cdot v$, for Q_{M-3}, Q_{M-7}, \ldots in direction $(-1+i) \cdot v$ and for Q_{M-4}, Q_{M-8}, \ldots in direction $(1+i) \cdot v$.
- This could be done by general method of rotating calipers.

イロト 不聞 と 不良 と 不良 とう 悪

You are given a polygon. You have to split it onto g parts with equal areas using only vertical cuts.

훞

<ロ> (日) (日) (日) (日) (日)

- Calculate the area of the polygon S.
- For each *i* we want to find a cut that produces the part with area $(i+1)\frac{s}{g}$.
- Use binary search on the location of the cut.
- Calculate the area of the part of the polygon lying to the left of the cut.

- You are given two lines with some number of points.
- There are some segments from the points on the first line to the points on the second.
- You have to count the number of intersections.

- Not really a geometry problem.
- Take a segment and iterate through all other segments.
- Two segments intersect if $a_i < a_j$ and $b_i > b_j$.
- The same as the number of inversion between array *a* and *b*.

イロト 人間ト イヨト イヨト

Problem statement

You have to cover given circles by two circles with minimal radius r.

훞

イロト イヨト イヨト イヨト

- Binary search on the answer r.
- We can always move a circle in such a way that it will touch some two circles.
- We build all the candidate circles and check each pair of them to cover all given circles.

- We are given two circles with radius r_1 and r_2 and want to build a circle with radius r that touches them.
- The center of that circle is the point of intersection of two circles with radiuses $r r_1$ and $r r_2$ with the centers in the corresponding centers of two provided circles.

- You are given a ball that falls from infinite height at x = X.
- There are some segments that could change trajectory of a ball.
- When the ball falls onto some segment, it slides off at its lowest point.
- Find last the x-coordinate of the ball.

イロト イ押ト イヨト イヨト

- Let's for every segment find another segment right 'below' it
- After that's known, the rest of the problem is trivial
- Use sweep line technique
- Create 'left' and 'right' events for each segment, sort all events
- Keep currently open segments sorted by their y-coordinate.

◆□> ◆圖> ◆園> ◆園>

- You can compare two segments given a current *x*-coordinate.
- It is possible to do it with a standard vectMul predicate.
- All the segments you have to compare have overlapping x-projections.
- Find any point on one segment that is in x-projection of another, and check the angle.
